How it Works: Cat Slideshow

     This project uses Vue.js components to create a template for each slideshow. Data is drawn from the cat API using Axios which is shown in the slides. The breed of cat is selected in the HTML when a new "cats" tag is created by using a prop called whichcat. The value of whichcat is set to the desired cat. The page is styled using CSS which allows for the bar charts of the cat's traits to be color coded and sized appropriately.
